

IEEE Applied Power Electronics Conference 2024

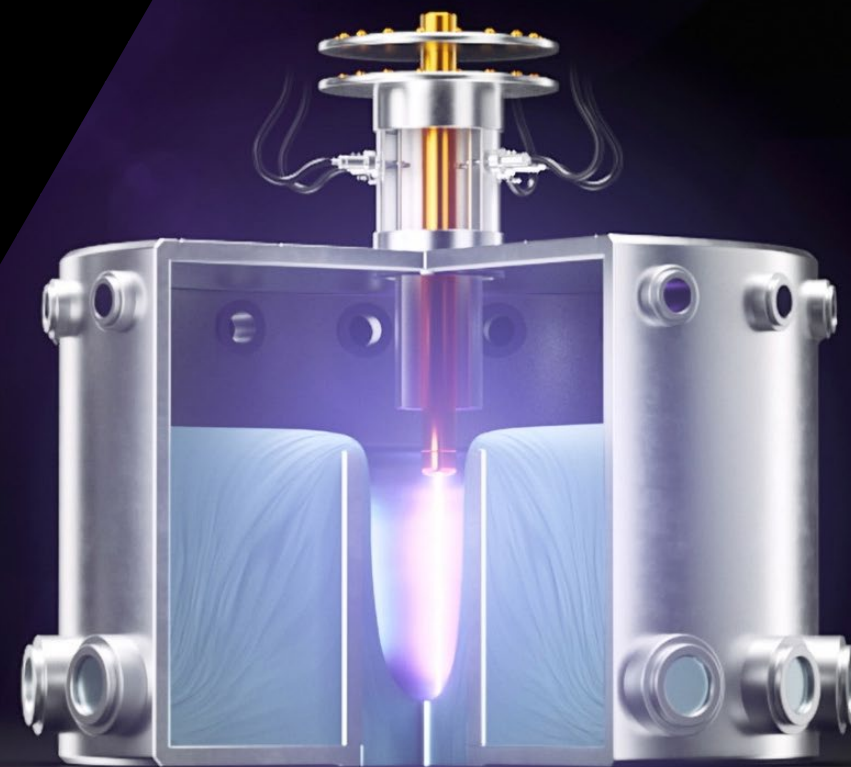

Fusion Energy on the Horizon

The Key Role of Power Electronics to Commercial Fusion

AJ Kantor
VP of Operations

Matthew C. Thompson
VP of Systems Engineering

Feb 26
2024

About Zap

- Founded in 2017
- Headquartered in Everett, WA (north of Seattle) with offices in San Diego and Denver
- The only fusion company focused on sheared-flow-stabilized Z-pinch
- Roughly 150 employees; 80% technical
- Built on research at the University of Washington and Lawrence Livermore National Laboratory dating back to the 1990s
- \$200M+ in funding by strategic investors

Fusion will be vital to meet future energy needs

Growth in energy demand and intermittent renewables in addition to electrification are creating a premium market for emissions-free baseload power sources

Climate change has raised the stakes. A net-zero energy transition is expected to require \$110 trillion through 2050²

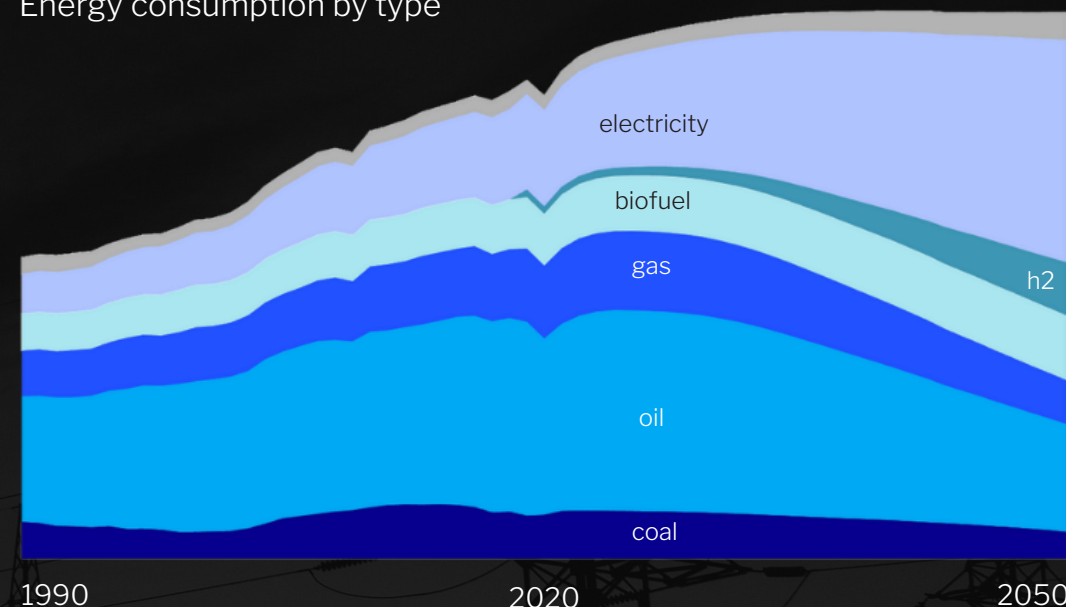

More than 40 private fusion companies have raised over \$6B to date, mostly in the last few years, adding talent and innovation³

Fusion leadership will be a national imperative. The federal government has begun to step up more broadly to support the nation's competitive position⁴

Energy consumption by type¹

By 2050:

3x

electricity demand

43%

of global energy use
remains fossil fuels

1) McKinsey & Co., *Global Energy Perspective 2022*

2) Energy Impact Partners, *Impact & Performance Report 2022*

3) Fusion Industry Association, *Annual Report 2023*

4) American Institute of Physics, *Federal Pivot to Supporting Commercial Fusion Energy Underway*

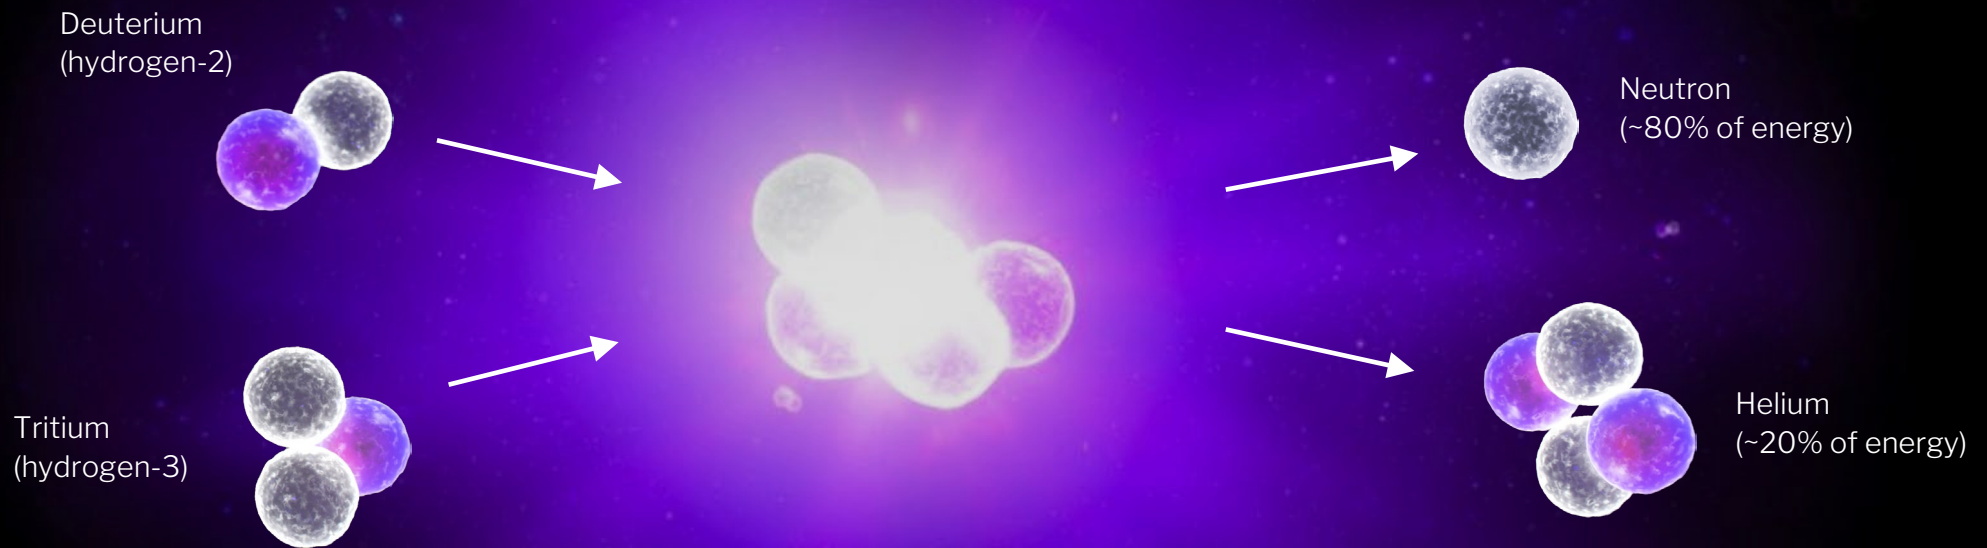

Why fusion?

On Demand / Baseload	Capable of high uptime and load balancing
Clean / Carbon- Free	No emissions or long-lived radioactive waste
Fuel Price & Abundance	Fuels are cheap and globally dispersed
Safety	No risk of meltdown or significant public health hazards
Land Efficiency	Can be flexibly sited, with a similar footprint to existing power plants
Public Acceptance	Clean slate, bipartisan support

Fusion fundamentals

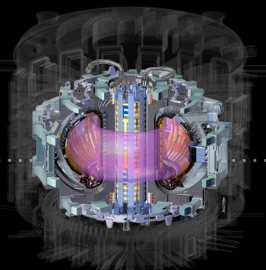

The case for medium density fusion

Big Magnets

Continuous operation of low-density plasmas requires big, expensive devices

Tokamak (ITER)

Costs dominated by confinement

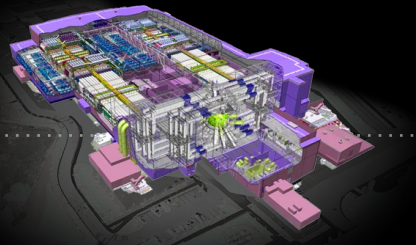

Zap

Medium-density, repetitive cycles offer thermal efficiency at lower cost

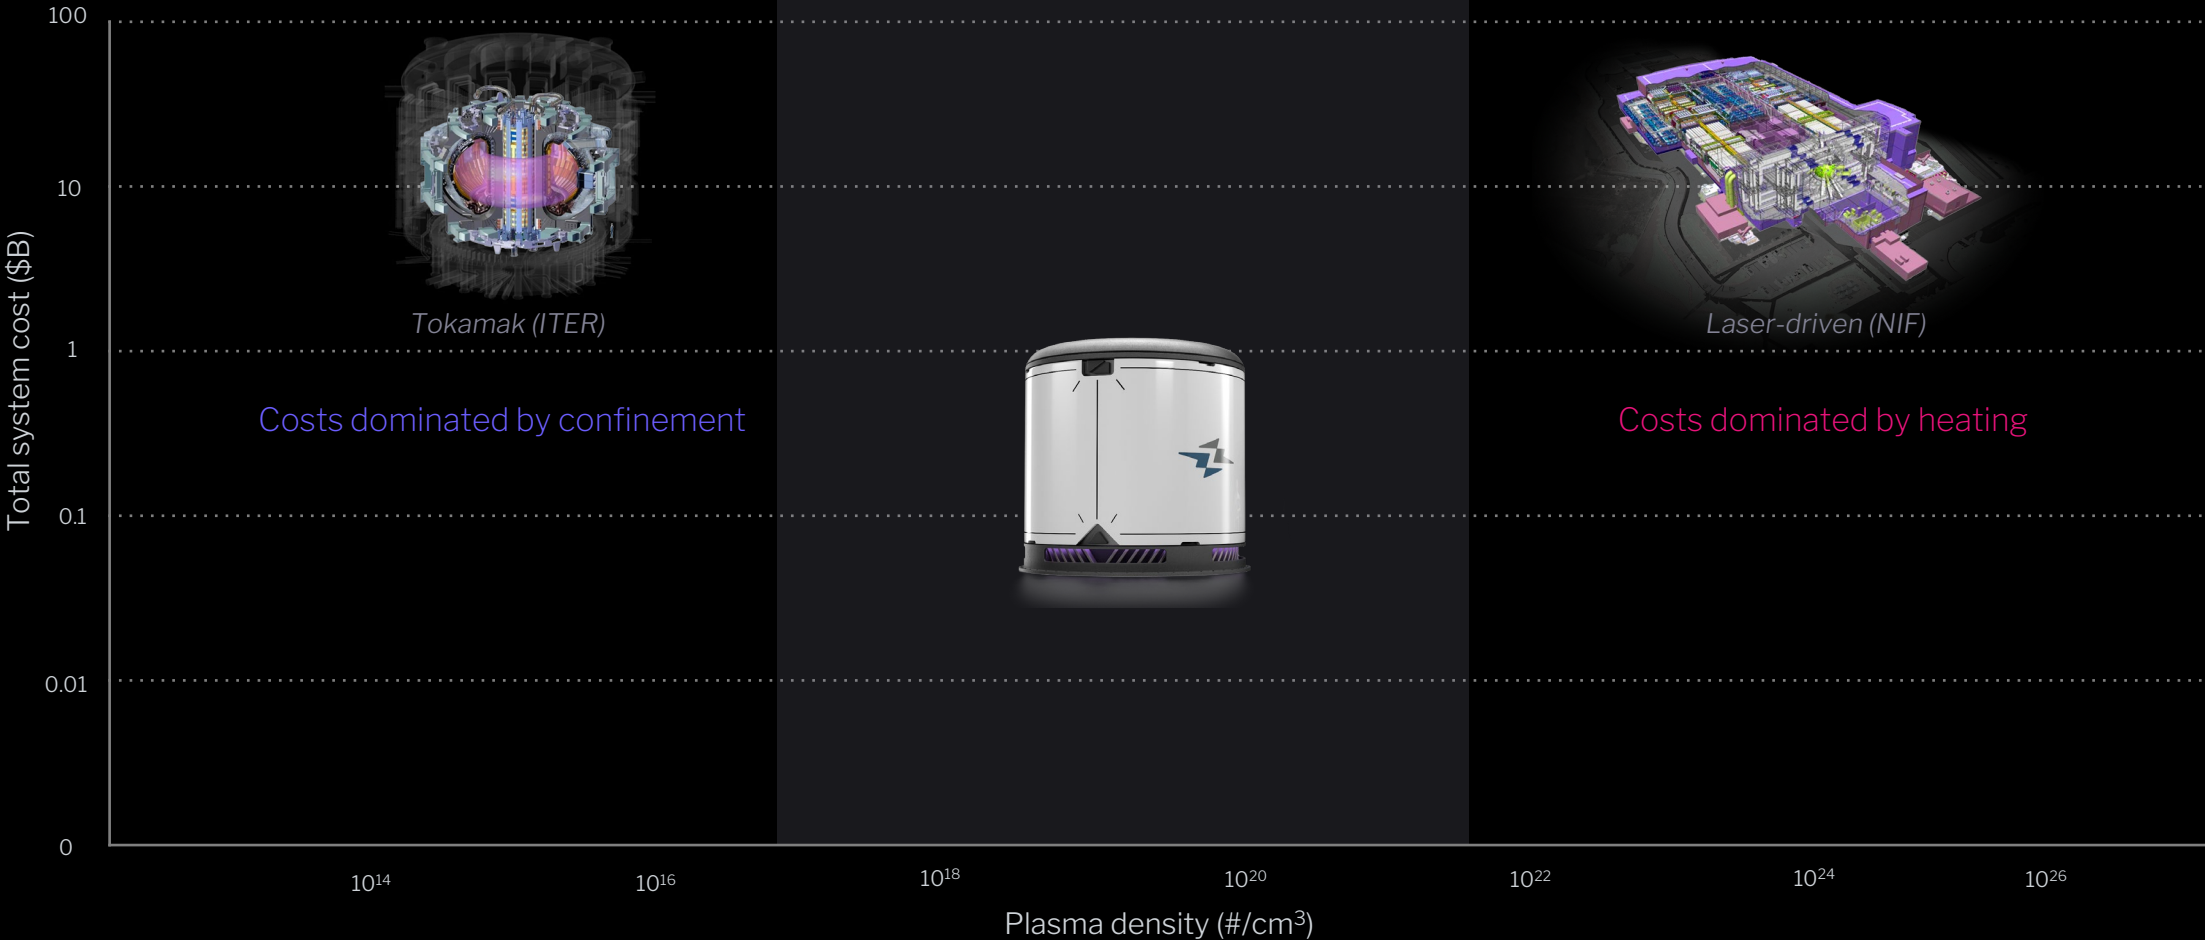

Big Lasers

High-density, explosive energy release requires high cost of power

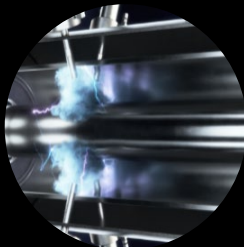

Laser-driven (NIF)

Costs dominated by heating

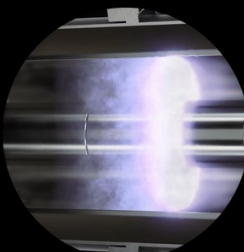

Z-Pinch fusion: magnetic confinement without magnets

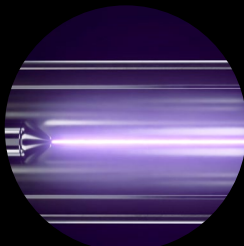

1. Ionize

Deuterium gas injected and ionized into plasma

2. Accelerate

Plasma accelerates down coaxial accelerator

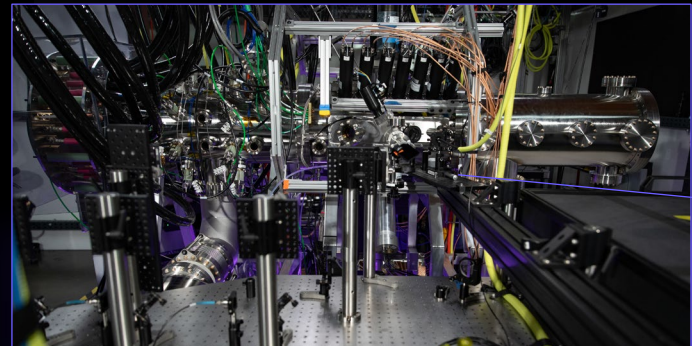

3. Pinch

Z-pinch plasma column assembles on axis and compresses

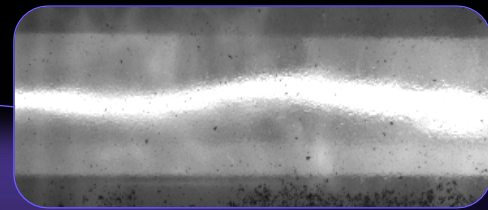

4. Fuse

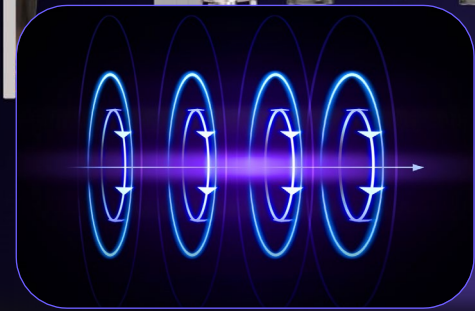

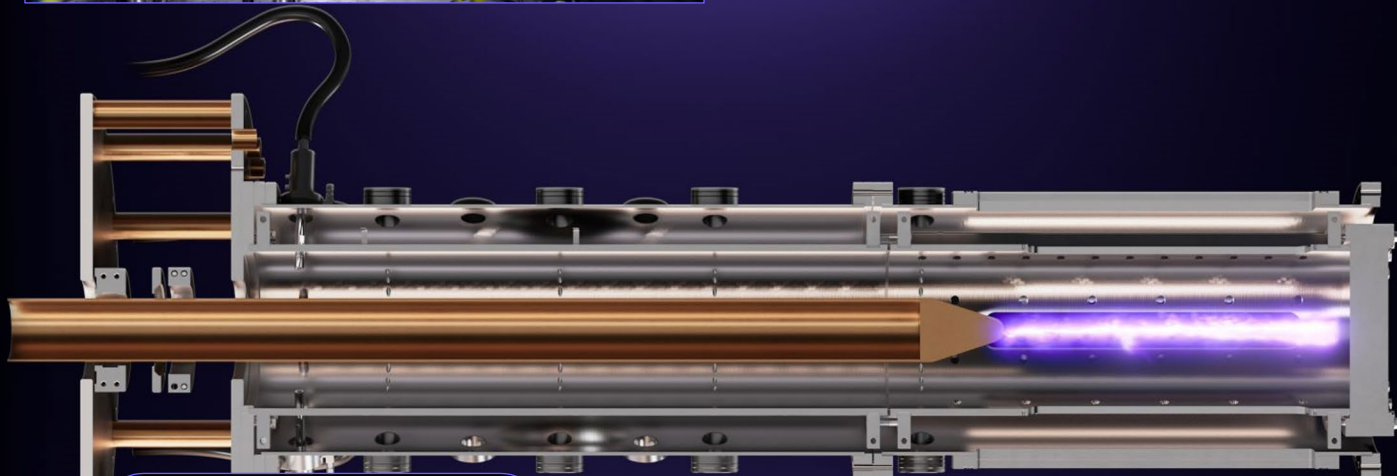

Fusion neutrons detected to diagnose fusion reactions

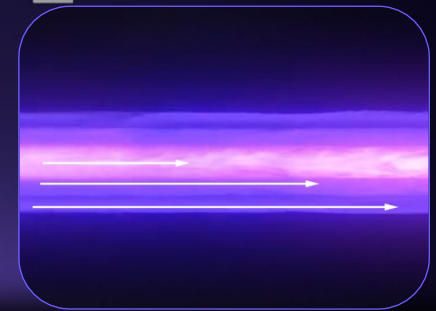

High-speed image

Plasmas
~50cm long
last tens of
microseconds

Z-pinch
compression
creates
fusion

Embedded
sheared flow
provides
stabilization

SFS Z-pinch plasmas lead to better power plant economics

Size of Device

~25 m³ core size for 50 MWe

Complexity

No magnets, cryogenic or lasers

Iteration Speed

Single-year cycle

Fuel

Deuterium-tritium

Neutron Damage

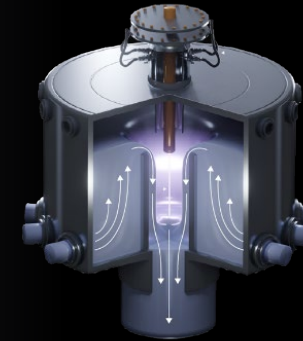

No solid first wall, resilient liquid metal design

Plant Design

Modular, factory-built cores

R&D Prototype

Integrated Demonstration

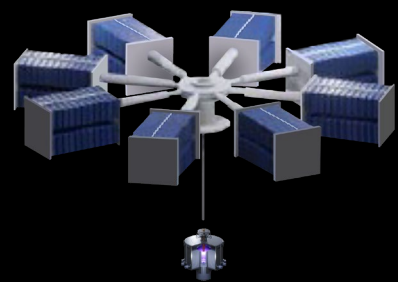

Commercial Systems

Beyond physics: developing power plants

High rep-rate pulsed power

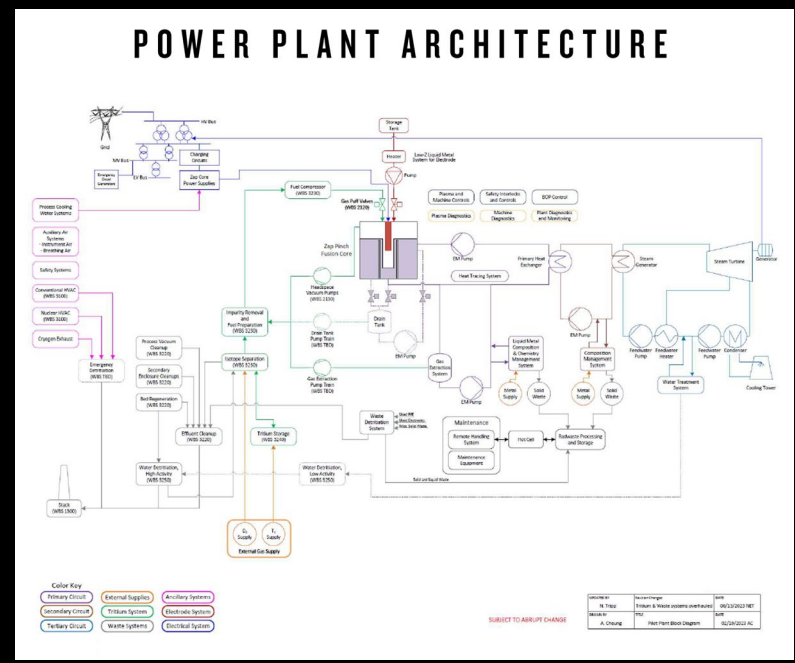

First-gen advanced power source subsystem

Circulating liquid metal

Circulating liquid metal test stand

System integration and pilot plant design

Preliminary power plant design schematic

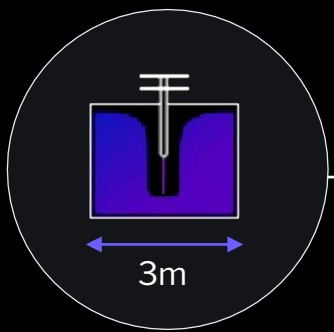

Engineering paradigms

~20 MW Drive
~200 MW Thermal
~ 50 MW Electric Output

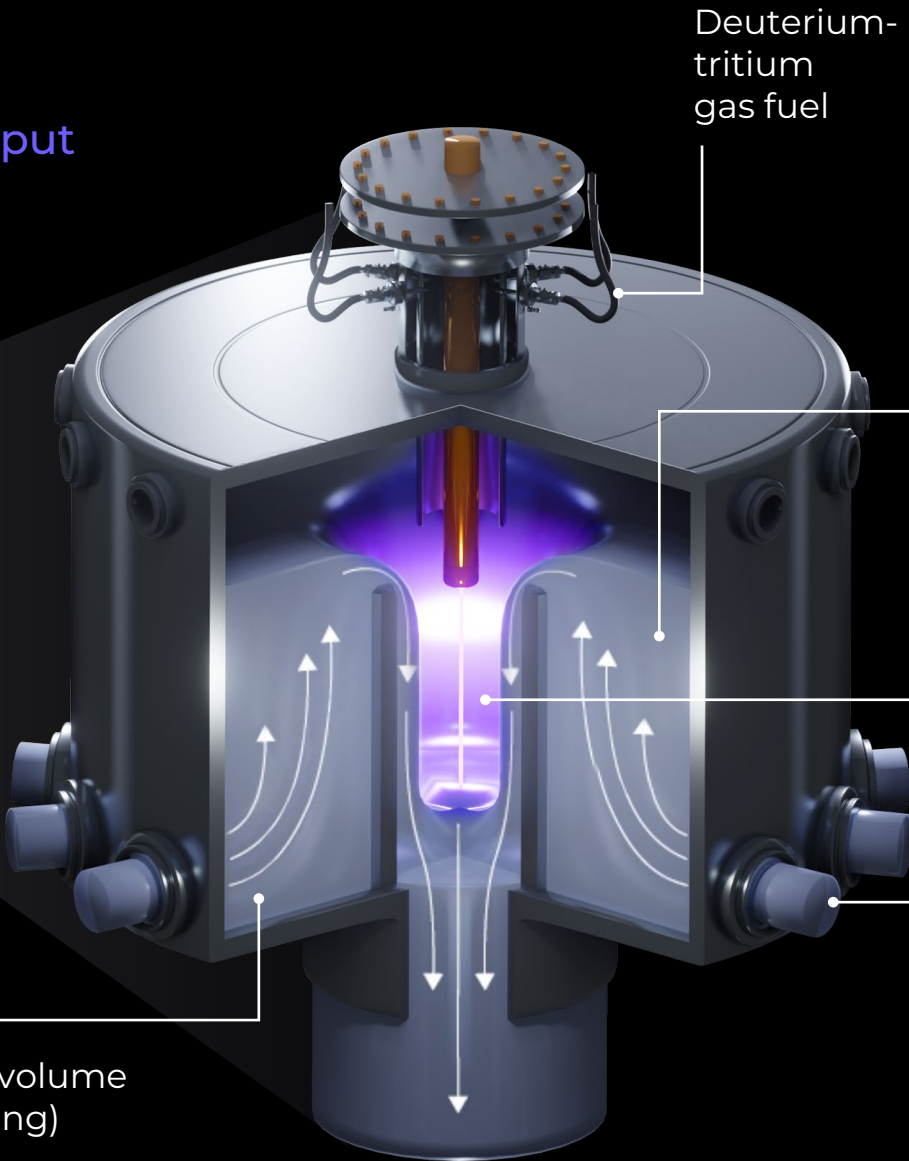

10 Hz Pulsed Power Supply

Scale of device relative to power supply

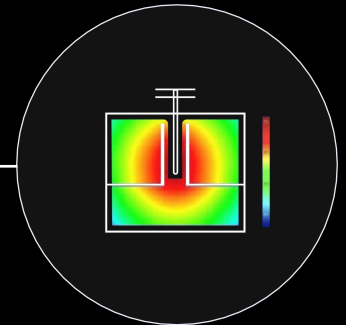

~25m³ volume (shielding)

Deuterium-tritium gas fuel

On-site tritium production

50cm linear plasma (energy source)

Circulating liquid metals

- Heat transfer medium
- Tritium fuel production
- Renewable plasma facing surfaces
- Neutron shielding

Fusion and recirculating power

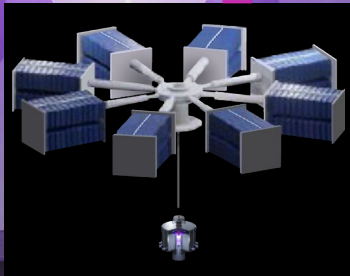

~200 MW fusion yield

Fusion yield + drive power heats liquid metal

~40% thermal generating efficiency

~20 MW to plasma

~40 MW to plant

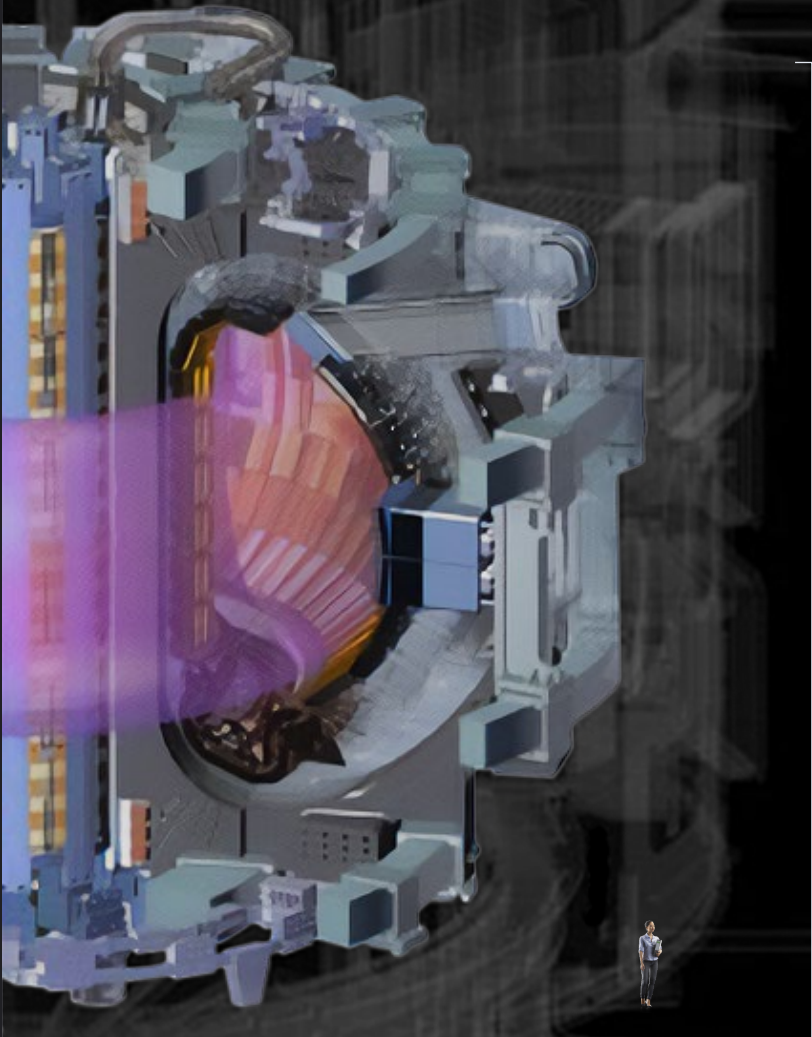

~50 MW to grid

Tokamaks vs. Z-pinch

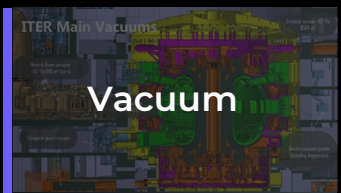

Zap requires far fewer plasma subsystems

Tokamak core (ITER)

20m

Tokamak major subsystems

Vacuum

Magnetic Coils

Cryogenic Plant

Auxiliary Heating

Power Supplies:

- Toroidal Field Coils
- Poloidal Field Coils
- Power Management
- Energy Storage
- Breakdown
- Real-Time Control
- Auxiliary Heating
- Diagnostics
- Facility

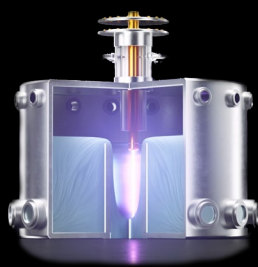

SFS Z pinch major subsystems

Vacuum

Power Supplies:

- Power Management
- Energy Storage
- Breakdown
- Diagnostics
- Facility

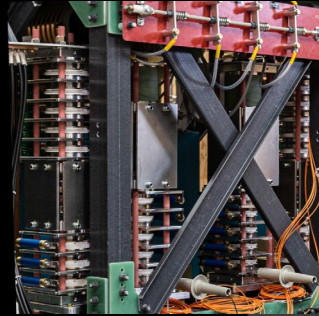

SFS Z-pinch core (Zap)

4m

Power electronics in Zap power plants

High Power Driver

Pinch-driven fusion needs GW peak power switches with fast rise times

SCADA, safety,
automation

Recirculating

Power conditioning, conversion, etc.

Fusion Core

Harsh environment sensing technologies (high voltage, heat flux, pressure, radiation, etc.)

Power Conversion

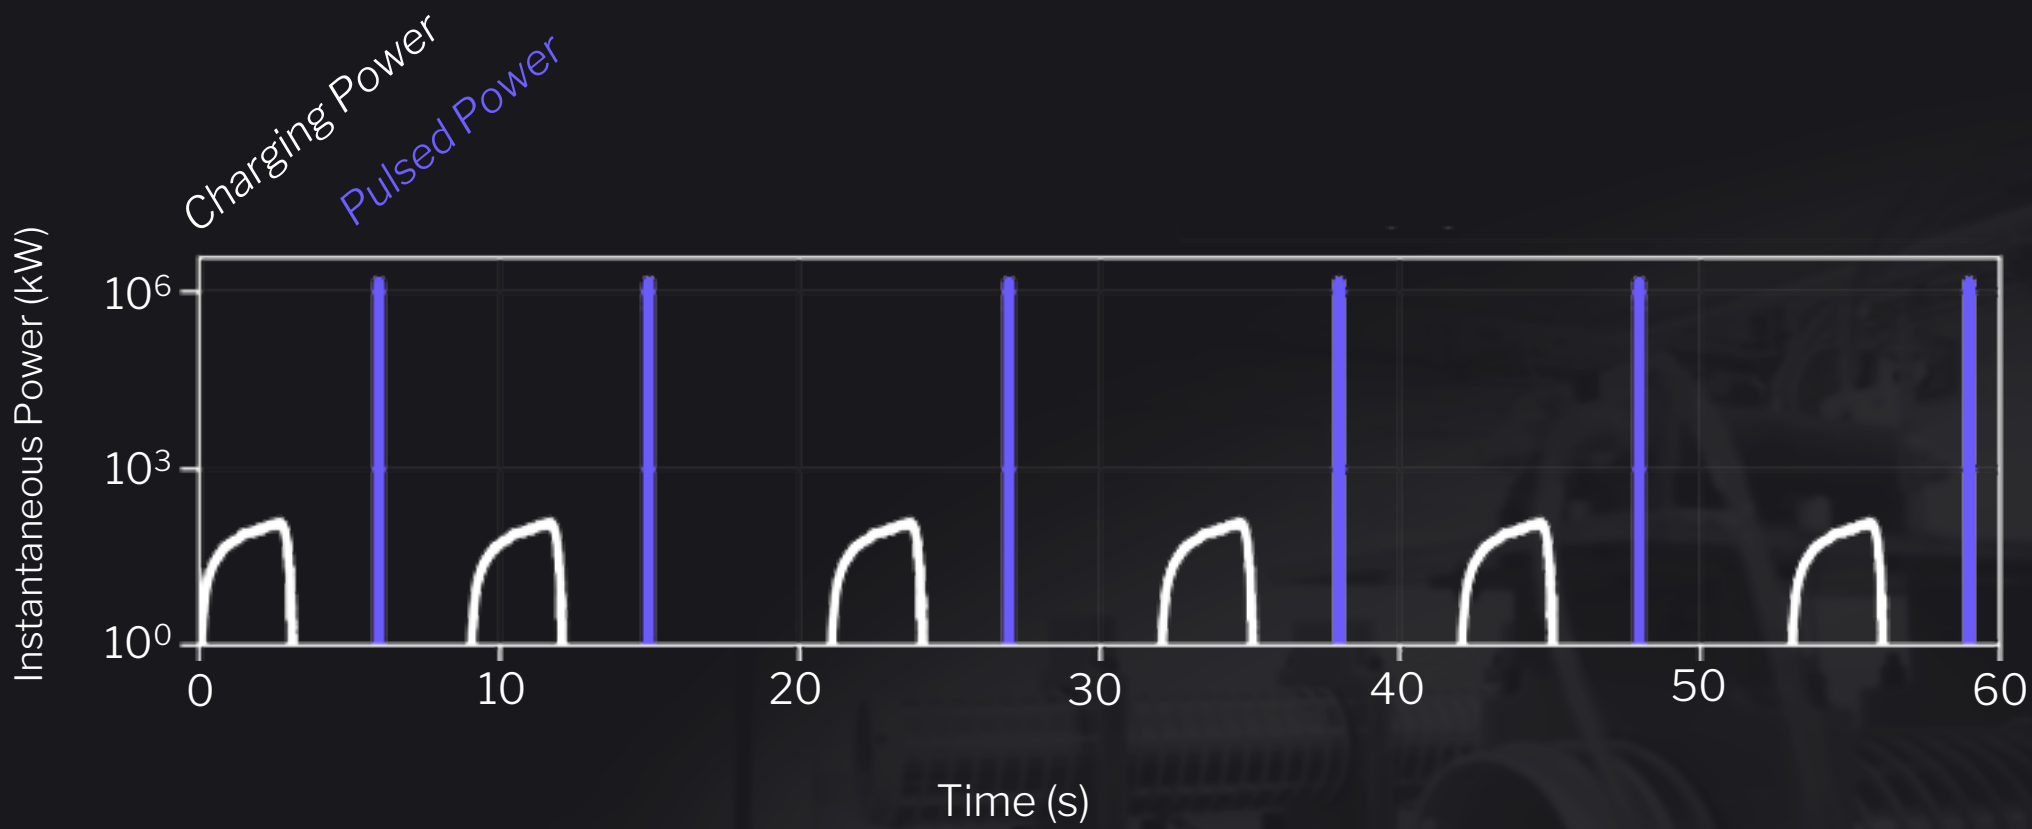

Thermal to power conversion, industrial motor drives, output efficiency

Power to grid

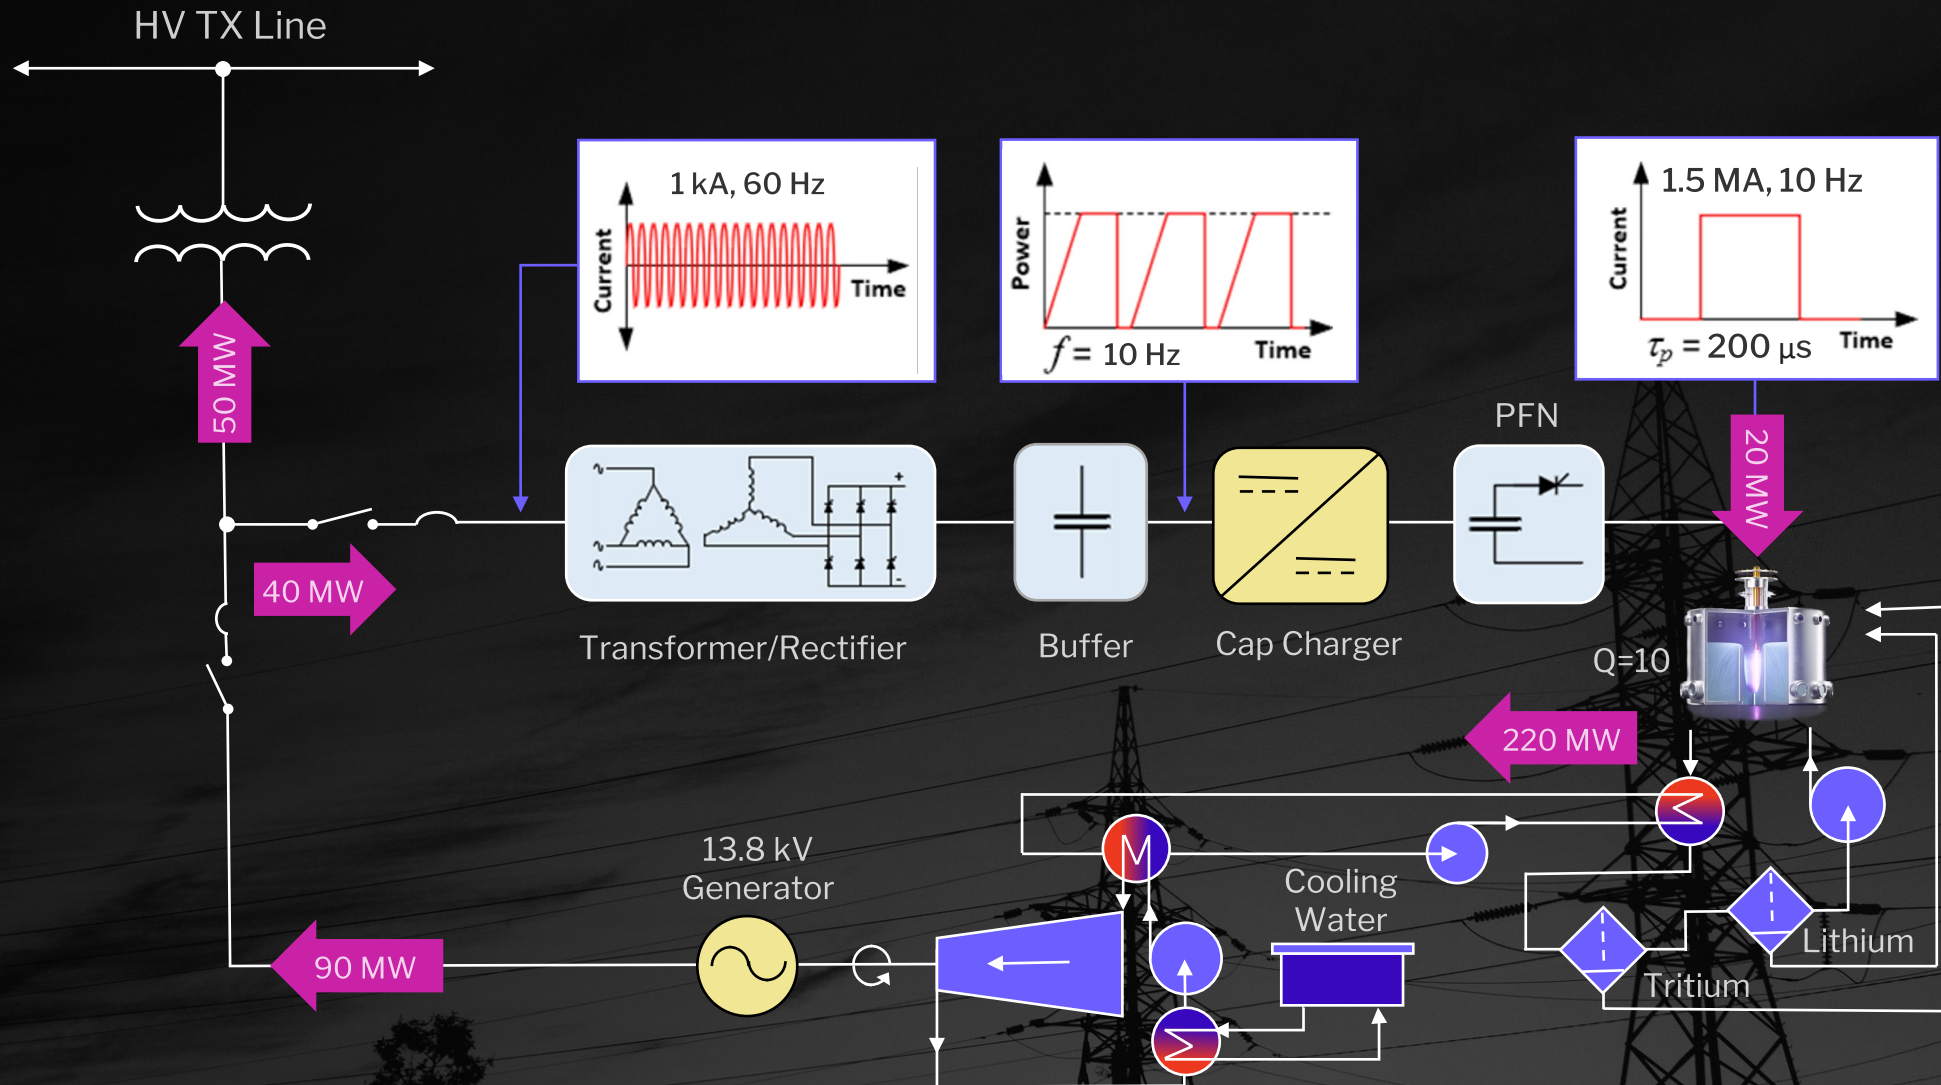

Z-pinch driver circuits compress power pulses

Data from our prototype repetitive Z-pinch driver

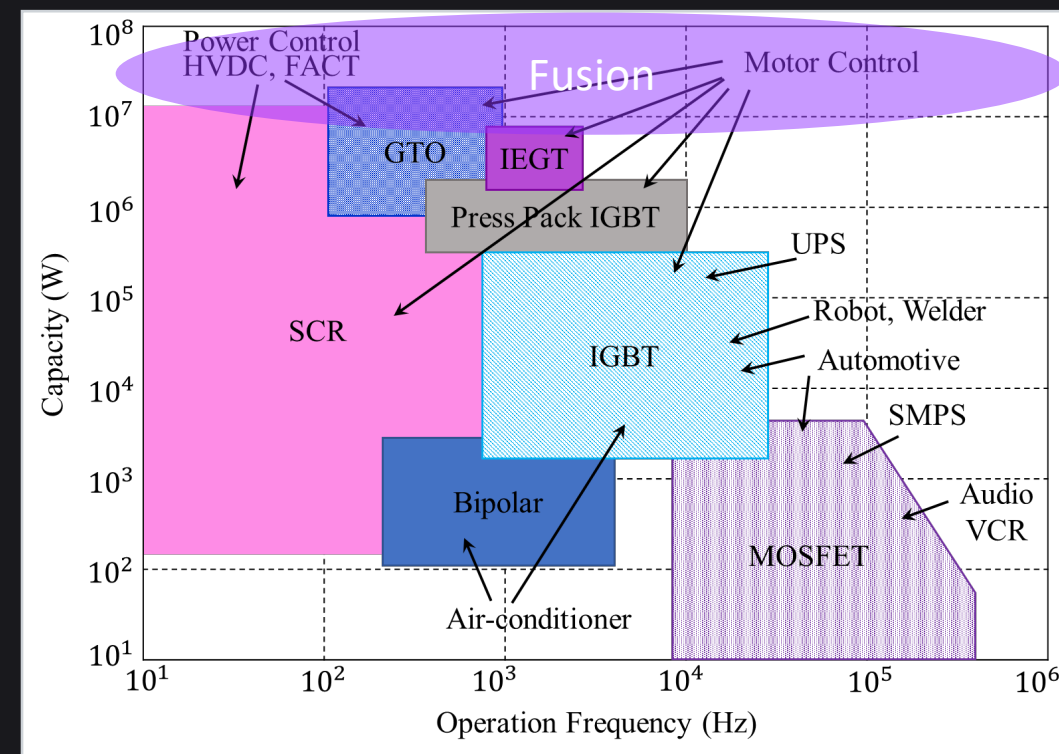

Plant electrical system

Technological Challenges: Semiconductor switches

- Repetitive pulsed power is not a traditional semiconductor switch application
- Cost-effective advancements needed in peak power capability
- Development in this field would unlock faster fusion progress and switch market growth

Application areas of classical discrete power semiconductors
